Visão Geral – Internal Ads Reporting Dashboard

Google Ads API – Tool Design Document · Owner: Mauricio (paid media manager, Brazil) · Contact: mauricios9175@gmail.com

1. Overview

Visão Geral is a private, internal web dashboard used by a single paid-media professional to monitor the advertising performance of the clients they manage. It consolidates read-only performance data from Meta Ads, Google Ads and the clients' CRMs in one place, so that the account manager does not need to open each ad account separately.

The tool is **read-only**: it never creates, edits, pauses or deletes campaigns, ads, keywords, budgets or bids. All campaign management continues to be done directly in the Google Ads interface.

2. Business model and users

- The owner is an independent paid traffic manager who manages Google Ads and Meta Ads accounts for small and medium businesses in Brazil, either directly (as an admin user on the client's account) or through partner agencies' manager accounts (MCC) where access has been granted access.
- **Users:** internal only – the account owner only. Clients do not log in and have no access to the tool. The tool is not sold, licensed or offered to third parties.
- Access to the dashboard is protected by password authentication.

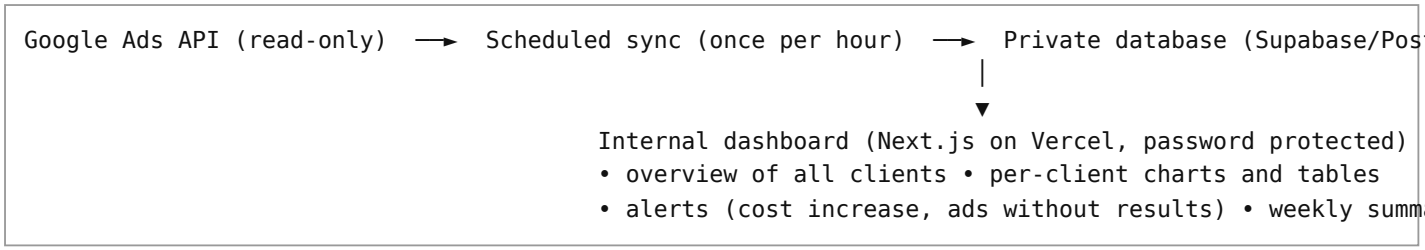

3. How the tool uses the Google Ads API

Feature	API usage
List accounts the user can access	CustomerService.ListAccessibleCustomers; GoogleAdsService.Search on *customer_client* to list client accounts under manager accounts.
Daily performance per client	GoogleAdsService.SearchStream (GAQL) reading *campaign*, *ad_group* and *ad_group_ad* metrics by day: cost_micros, impressions, clicks, ctr, conversions, conversions_value, cost_per_conversion.
Campaign status	Read-only fields campaign.status / ad_group_ad.status to show whether items are active or paused.
Weekly client summary	Uses the stored daily metrics to produce a text summary that the owner reviews and sends manually to each client.

No mutate operations are used. The tool only calls reporting/read endpoints.

4. Authentication and data flow

- OAuth 2.0 (web application flow) with the scope *https://www.googleapis.com/auth/adwords*. The owner signs in with their own Google account; the refresh token is stored encrypted at rest in the tool's private database.
- The developer token belongs to the owner's own manager account and is used only by this tool.
- When an account is accessed through a partner agency's manager account, the *login-customer-id* header is set to that manager account, as allowed by the access the agency granted.

5. API call volume

- Approximately 30–50 client accounts.

- One reporting sync per hour (last 2 days) plus one nightly sync (last 7 days); estimated well under 2,000 API operations per day, far below Basic Access limits.
- Requests are batched with SearchStream and retried with exponential backoff on RESOURCE_EXHAUSTED errors.

6. Data handling

- Only aggregated performance metrics and campaign/ad names are stored; no end-user personal data is retrieved from Google Ads.
- Data is used solely to report results to the respective advertiser (client) and is never shared with or sold to third parties.
- Access tokens and refresh tokens are kept server-side only and never exposed to the browser.

7. Screens (description)

1. **Overview:** one card per client with spend, conversions, cost per conversion vs. target, and budget pacing.
2. **Client page:** daily charts (spend, conversions, cost per conversion) and tables by campaign, ad group and ad, with active/paused status.
3. **Alerts:** list of accounts needing attention (cost per conversion increase, ads spending without conversions, best-performing ads).
4. **Reports:** weekly text summary per client, reviewed and copied manually by the owner.
